for B.Sc. part I, paper 1(A)

Question: Pila ko classify karay hu
chitra सहित वर्णन करेय.

Phylum - Mollusca

Class - Gastropoda

Order - Streptoneura

Genus - Pila

Characteristics:-

→ Pila is the common Apple
Snail which is found in ponds
ditch, rivers and in water
filled.

→ The soft body is covered by a coiled shell. The first chamber of the shell is apex, the last one is body whorl with a depression called Vortex and an opening the Columella.

→ The shell has a large opening which is covered by operculum. Below the shell is the thin transparent covering called mantle which covers the visceral mass.

→ The soft body of pila can be divide into head, foot and visceral mass. head has a pair of eyes, tentacles and labial palps.

→ Foot is a highly muscular creeping organ.

Shell:-

→ The soft body of pac pila is covered by a calcareous shell. It is spirally coiled. The coils of the shell are called whorls.

→ The upper whorl is called aper. The aper is the first formed whorl. The lower most whorls are larger called body whorl.

→ The shell opens out by a large opening called shell mouth. The margin of the mouth is called peristome or lip. It is formed of inner lip and outer lip.

If the shell is held with the aper away from the observer, the mouth is towards right. The shell of pila is dorsal.
