Mathematical How & Why

B.Sc. Part-I.

Paper-I

Topic: Relation between
the roots and co-
efficient.

(Theory of Equation)

~~Q. 2~~ (1.) Solve the equation
 $x^3 - 9x^2 + 14x + 24 = 0$, two
of whose roots are in the
ratio (i) 2:3 (ii) 3:2.

Solⁿ: Let the roots of the
equation be 2α , 3α and β . Then
we have

$$2\alpha + 3\alpha + \beta = 9 \text{ or, } 5\alpha + \beta = 9 \quad \text{--- (1)}$$

$$2\alpha \cdot 3\alpha + 2\alpha \cdot \beta + 3\alpha \cdot \beta = 14 \quad \text{--- (2)}$$

$$\text{or, } 6\alpha^2 + 5\alpha\beta = 14 \quad \text{--- (2)}$$

$$\text{and } 2\alpha \cdot 3\alpha \cdot \beta = -24$$

$$\text{or } 6\alpha^2\beta = -24$$

$$\text{or } \alpha^2\beta = -4 \quad \text{--- (3)}$$

Multiplying (1) by 5α , we get

$$25\alpha^2 + 5\alpha\beta = 45\alpha \quad \text{--- (4)}$$

Subtracting (2) from (4), we get

$$19\alpha^2 - 45\alpha + 14 = 0 \quad \text{--- (5)}$$

Comparing (5), we get

Date: 03/07/21

$$\alpha = \frac{45 \pm \sqrt{(45)^2 - 4 \cdot 19 \cdot 14}}{38}$$

$$= \frac{45 \pm \sqrt{2025 - 1064}}{38}$$

$$= \frac{45 \pm 31}{38}$$

$$= \frac{76}{38} \text{ or } \frac{14}{38}$$

$$= 2 \text{ or } \frac{7}{19}$$

if $\alpha = 2$, then from (i), $\beta = 9 - 10\alpha$

if $\alpha = \frac{7}{19}$ then from (i), $\beta = 9 - 5\alpha$

$$= 9 - 5 \cdot \frac{7}{19} = 9 - \frac{35}{19}$$

$$= \frac{136}{19}$$

But $\alpha = \frac{7}{19}$ and $\beta = \frac{136}{19}$ do

not satisfy (2),

Hence we take $\alpha = 2$

Therefore the roots are 4, 6, -1.

(ii) Let the roots of the given equation be 3α , 2α , β .

$$\text{Then } \Sigma \alpha = 3\alpha + 2\alpha + \beta = 9$$

$$\text{Or, } 5\alpha + \beta = 9 \quad \text{--- (1)}$$

$$\sum d^3 = 9d \cdot \beta + 2d \cdot \beta + 9d \cdot 2d = 14$$

$$\text{Or, } 5d^3 + 6d^2 = 14 \quad \text{--- (2)}$$

$$\text{Or, } 9d \cdot 2d \cdot \beta = 24$$

$$\text{Or, } 2^3 \beta = -4 \quad \text{--- (3)}$$

From (1) and (3) we get;

$$5d(9-5d) + 6d^2 = 14$$

$$\therefore \beta = 9-5d \text{ from (1)}$$

$$\text{Or, } 19d^2 - 45d + 14 = 0$$

$$\text{Or, } 19d^2 - 32d - 7d + 14 = 0$$

$$\text{Or, } (19d-7)(d-2) = 0$$

$$\text{Or, } d = 2, \frac{7}{19}$$

$$\therefore \text{From (1), } \beta = -1 \text{ or } \frac{126}{19}$$

$$d = 2 \text{ or } \frac{7}{19}$$

Also (2) is satisfied only for $d = 2$ and $\beta = -1$. Hence the required roots are $6, 4, -1$.

Q. (2) If one root of the equation $x^3 - px^2 + qx - r = 0$ be α , find the other root of the equation. Show that it may be found from a quadratic.

Solⁿ:-

Date _____
Page _____

Let the roots of the equation $x^3 - px^2 + qx - r = 0$ are $\alpha, n\alpha$ and β . Then

$$\Sigma \alpha = \alpha + n\alpha + \beta = p \quad \text{--- (1)}$$

$$\Sigma \alpha \beta = \alpha \cdot n\alpha + \alpha \cdot \beta + n\alpha \cdot \beta = q$$

Or, $n\alpha^2 + (n+1)\alpha\beta = q$

From (1), $\beta = p - (n+1)\alpha$ --- (2)

Substituting this value of β in (2), we get the required quadratic as

$$n\alpha^2 + (n+1)\alpha [p - (n+1)\alpha] = q$$

$$\text{Or } [n - (n+1)^2]\alpha + (n+1)p\alpha - q = 0$$

$$\text{Or, } (n^2 + n + 1)\alpha^2 - (n+1)p\alpha + q = 0$$

(3) Find the condition that the roots of the equation $x^3 - px^2 + qx - r = 0$ may be in an arithmetical progression and hence solve

$$x^3 - 12x^2 + 39x - 28 = 0.$$

Solⁿ:-

Let the roots of the equation be

$$a-d, a, a+d$$

\therefore Sum of the roots =

$$(a-d) + a + (a+d) = p$$

$$\text{Or } 3a = p \quad \text{--- (1)}$$

Since a is a root of the given equation, so we have $a^3 - pa^2 + qa - r = 0$

$$\text{Or, } \frac{1}{27}p^3 - p \cdot \frac{1}{9}p^2 + q \cdot \frac{p}{3} - r = 0$$

$$\text{Or, } 2p^2 - 9pq + 27r = 0 \quad \text{from (1)}$$

Which is the required condition

Now, let $a-d, a, a+d$ be the roots of $x^3 - 12x^2 + 39x - 28 = 0$

$$\therefore \Sigma \alpha = (a-d) + a + (a+d) = 12$$

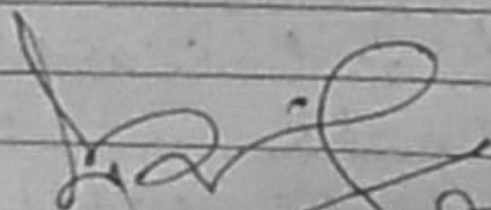

$$\text{Or, } 3a = 12 \quad \text{Or } a = 4 \quad \text{--- (A)}$$

$$\Sigma \alpha\beta = (a-d) + a + (a-d)(a+d) + a(a+d) = 39$$

$$\text{Or, } 3a^2 - d^2 = 39 \quad \text{Or, } 48 - d^2 = 39$$

$$\text{Or, } d^2 = 9, \quad \therefore d = \pm 3 \quad (\because a=4)$$

\therefore The roots are: 1, 4, 7.
