Topic: Linear equations with constant coefficients (Diff. eqn)

Linear equations are those equations in which dependent variable and its derivatives appear only in the first degree and are not multiplied together.

The general differential equation of the  $n$ th order is

$$x \frac{d^n y}{dx^n} + P_1 \frac{d^{n-1} y}{dx^{n-1}} + P_2 \frac{d^{n-2} y}{dx^{n-2}} + \dots + P_{n-1} y = X.$$

Where  $x$  and the coefficients  $P_1, P_2, P_3, \dots, P_{n-1}$  are functions of  $x$  only.

Here the equation is linear. Since the dependent variable  $y$  and its differential coefficients occur in the first degree. If  $P_1, P_2, P_3, \dots, P_{n-1}$  are constants and  $X$  be the function of  $x$  alone, then the above equation

Page  
is said to be the linear differential equation with constant coefficients.

## Linear Equations with Constant Coefficients:

Let the general linear equation with constant coefficients be of the form

$$\frac{d^n y}{dx^n} + P_1 \frac{d^{n-1} y}{dx^{n-1}} + P_2 \frac{d^{n-2} y}{dx^{n-2}} + \dots + P_{n-1} y = X \quad \text{--- (1)}$$

where  $P_1, P_2, \dots, P_{n-1}$  are constants and  $X$  is a function of  $x$  for a constant.

### Theorem I:

If  $y_1, y_2$  are any two solutions of

$$\frac{d^n y}{dx^n} + P_1 \frac{d^{n-1} y}{dx^{n-1}} + P_2 \frac{d^{n-2} y}{dx^{n-2}} + \dots + P_{n-1} y = 0 \quad \text{--- (2)}$$

$$+ \dots + P_{n-1} y = 0 \quad \text{--- (2)}$$

(The R.H.S,  $\lambda = 0$ ),  
 $C_1 y_1 + C_2 y_2$  is also a solution  
 of (2),  $C_1, C_2$  being arbitrary  
 constants.

Proof: Since  $y_1, y_2$  are  
 solutions of (2), we have

$$\frac{d^n y_1}{dx^n} + P_1 \frac{d^{n-1} y_1}{dx^{n-1}} + P_2 \frac{d^{n-2} y_1}{dx^{n-2}} + \dots + P_n y_1 = 0 \quad \text{--- (3)}$$

$$\frac{d^n y_2}{dx^n} + P_1 \frac{d^{n-1} y_2}{dx^{n-1}} +$$

$$P_2 \frac{d^{n-2} y_2}{dx^{n-2}} + \dots + P_n y_2 = 0 \quad \text{--- (4)}$$

In order to show that  
 $C_1 y_1 + C_2 y_2$  is a solution of  
 (2), we need to show that  
 $y = C_1 y_1 + C_2 y_2$  satisfies (2)

Now,  $\frac{d^n}{dx^n} (C_1 y_1 + C_2 y_2) +$   
 $P_1 \frac{d^{n-1}}{dx^{n-1}} (C_1 y_1 + C_2 y_2) +$   
 $P_2 \frac{d^{n-2}}{dx^{n-2}} (C_1 y_1 + C_2 y_2) + \dots$

Date \_\_\_\_\_  
Page \_\_\_\_\_

$$= C_1 \left( \frac{d^n y_1}{dx^n} + P_1 \frac{d^{n-1} y_1}{dx^{n-1}} + \dots + P_2 \frac{d^{n-2} y_1}{dx^{n-2}} + \dots \right)$$

$$+ C_2 \left( \frac{d^n y_2}{dx^n} + P_1 \frac{d^{n-1} y_2}{dx^{n-1}} + \dots + P_2 \frac{d^{n-2} y_2}{dx^{n-2}} + \dots \right)$$

$$= C_1 \times 0 + C_2 \times 0$$

(because of ③ and ④)

$\therefore = 0$   
This proves the theorem.

Symbolic representation of

$$\frac{d^n y}{dx^n} + P_1 \frac{d^{n-1} y}{dx^{n-1}} + P_2 \frac{d^{n-2} y}{dx^{n-2}} + \dots + P_n y = 0$$

Let,  $D$  stand for  $\frac{d}{dx}$

$D^2$  for  $\frac{d^2}{dx^2}$

and  $D^n$  for  $\frac{d^n}{dx^n}$ .

$$\frac{1}{x} = \frac{0 \cdot \ln x + \frac{\pi}{4} + \pi n}{A}$$

$$\ln x + \frac{1}{x} +$$

$$\frac{1}{x^2} \ln x = 2 \cdot \ln x$$

$$\frac{1}{x^2} \ln x + \frac{1}{x} =$$

$$\frac{1}{x^2} \ln x - 1$$

Obtaining the result by case

$$\frac{1}{x^2} \ln x + \frac{1}{x} =$$
