Name OF the Topic:

Continuity & differentiability of function

Q. Show that the function $f(x, y) = \frac{xy^3}{x^2 + y^6}$, $x \neq 0, y \neq 0$

and $f(0, 0) = 0$, is not continuous at $(0, 0)$ in (x, y) together but the function is continuous in x alone and y alone at the origin.

Solution! Here $f(x, y) = \frac{xy^3}{x^2 + y^6}$

$x \neq 0, y \neq 0$ and $f(0, 0) = 0$.

Let $f(x, y)$ approached $(0, 0)$ through any line $y = mx$. We obtain, $\lim_{x \rightarrow 0} \frac{x \cdot m^3 x^3}{x^2 + m^6 x^6}$

$$= \lim_{x \rightarrow 0} \frac{m^3 x^4}{1 + m^6 x^6}$$

$= 0$

$\neq 0$

Again, let (x, y) approach $(0, 0)$ through the curve $x=y^3$.
Then we have

$$\lim_{y \rightarrow 0} \frac{y^3 y^3}{y^6 + y^6} = \lim_{y \rightarrow 0} \frac{y^6}{2y^6} = \frac{1}{2}$$

Since the limit obtained by the two approaches are different, therefore the simultaneous limit of $f(x, y)$ at $(0, 0)$ does not exist.

Hence the function is not continuous at $(0, 0)$ in (x, y) together.

Putting either variable and then letting the other variable approach zero.

i.e., putting $y=0$, $\lim_{x \rightarrow 0} \frac{x \cdot 0}{x^2 + 0} = 0$

$\lim_{x \rightarrow 0} \frac{0}{x^2} = 0$

Similarly putting $x=0$,

$$\lim_{y \rightarrow 0} \frac{0 \cdot y^3}{0 + y^6} = 0$$

$$\therefore f(0, 0) = 0$$

Therefore the function is continuous in x alone and in y alone at the origin.

Q: Construct an example of a function which is separately continuous but not continuous.

Solⁿ: Let a function

$$f(x, y) = \begin{cases} \frac{x^2 y^2}{x^4 + y^4}, & (x, y) \neq (0, 0) \\ 0, & \text{at } (0, 0) \end{cases}$$

This function is not continuous at $(0, 0)$ for $\lim_{(x, y) \rightarrow (0, 0)} f(x, y)$

does not exist. We see by

taking $(x, y) \rightarrow (0, 0)$ through the curve $y = mx$, $m \neq 0$, we

$$\text{have } f(x, y) = \frac{x^2 \cdot m^2 x^2}{x^4 + m^4 x^4}$$

$$= \frac{m^2 x^4}{x^4 (1 + m^4)} = \frac{m^2}{1 + m^4}$$

which is not independent of m .

$$\text{But } \lim_{x \rightarrow 0} f(x, 0) = \lim_{x \rightarrow 0} \frac{x^2 \cdot 0}{x^4 + 0}$$

$$= 0 = f(0, 0)$$

$$\text{and } \lim_{y \rightarrow 0} f(0, y) = \lim_{y \rightarrow 0} \frac{0 \cdot y^2}{0 + y^4}$$

Thus f is separately continuous but it is not continuous at $(0, 0)$. \triangleleft

Q: Investigate for continuity at $(2,3)$, the function f defined by

$$f(x,y) = \begin{cases} 3xy, & (x,y) \neq (2,3) \\ 4, & (x,y) = (2,3) \end{cases}$$

Solution:

Here, given that the function $f(x,y) = 3xy$ when $(x,y) \neq (2,3)$

and $f(x,y) = 4$ when $(x,y) = (2,3)$

$$\text{Now, } \lim_{(x,y) \rightarrow (2,3)} f(x,y) =$$

$$\lim_{(x,y) \rightarrow (2,3)} 3xy = 3 \cdot 2 \cdot 3 = 18$$

$$\text{and } f(2,3) = 4 \quad \text{--- (2)}$$

from (1) and (2),

$$\text{Since } \lim_{(x,y) \rightarrow (2,3)} f(x,y) \neq f(2,3)$$

Hence f is not continuous at $(2,3)$ if the function $f(x,y)$ had the value 18 at $(2,3)$, it would then be continuous at $(2,3)$.
